

Manual Testing

How to test your website before submitting for Assessment

What is manual testing?

- ❖ Manual testing is the process your project will be brought through during the Assessment phase. The Assessor will thoroughly test each feature, each user story and each purpose of your project.
- ❖ To prepare for the Assessment, it is necessary that student conducts their own manual testing and the outcome of manual testing is a thorough write up on README.

What do we test?

Responsiveness

Browser
Compatibility

Bugs

Recommended Tools:

- ❖ Chrome Developer Tools - check throughout the development

Include screenshots in README

Lighthouse

Code Validation

User Stories

Features

Responsiveness

How we test it and how to Document it?

Example approach

Step 1

Open project in DevTools

Step 2

Select few Devices and test the site

Step 3

Screenshot the outcomes

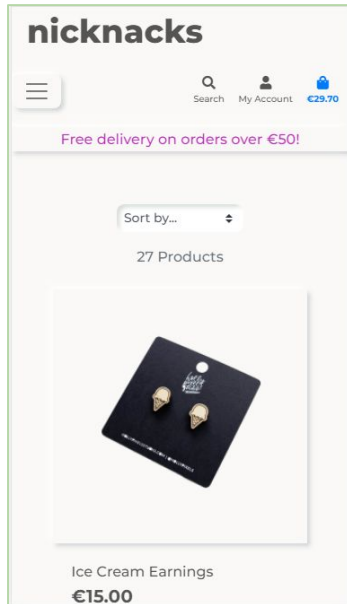

Step 4

Include screenshots in README

Home Page

All Products

Product Detail

Checkout

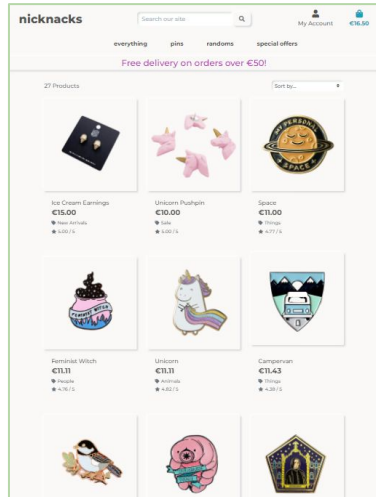

Responsiveness

Examples of iPad Pro screenshots

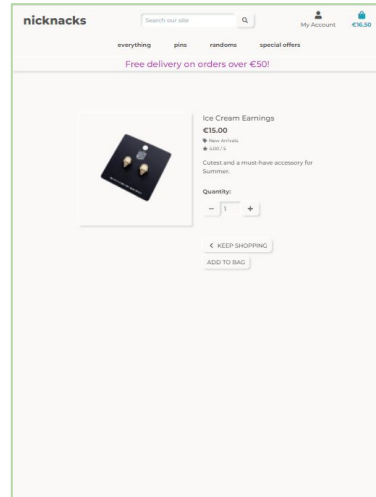

Home Page

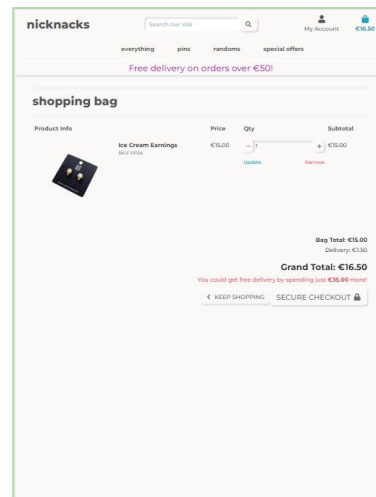

All Products

Checkout

Responsiveness									NOTES
	Galaxy S9+	Galaxy S5	iPhone 6/7/8	iPhone X	iPad	iPad Pro	Desktop 1024px	Desktop >1200px	my phone: Galaxy S9+ all others tested virtually online
Site is responsive $\geq 700\text{px}$	n/a	n/a	n/a	n/a	Good	Good	Good	Good	
Site is responsive $< 699\text{px}$	Good	Good	Good	Good	n/a	n/a	n/a	n/a	Game becomes too small $\sim < 300\text{px}$.
Links / URLs work	Good	Good	Good	Good	Good	Good	Good	Good	
Images work	n/a	n/a	n/a	n/a	n/a	n/a	n/a	n/a	Simon Game contains no images.
Renders as expected	Good	Good	Good	Good	Good	Good	Good	Good	

What do we test?

Responsiveness

**Browser
Compatibility**

Bugs

Recommended Tools:

- ❖ Choose 2-3 Browsers - check throughout the development

- ❖ Safari may or may not be selected, decide depending on your access to iOS

Include screenshots in README

Lighthouse

Code Validation

User Stories

Features

Example approach

Step 1

Open the site in tested browser

Step 2

Follow prepared test case

Step 3

Conclude findings in the README

Browser Compatibility							NOTES
	Chrome	Edge	Firefox	Safari	Opera	IE	
Intended appearance?	Good	Good	Good	Fair	Good	Poor	Tested Internet Explorer even though it's outdated. As expected, it behaves poorly. Safari is a bit mediocre as well, but still gets the job done as intended.
Intended responsiveness?	Good	Good	Good	Fair	Good	Poor	

What do we test?

Responsiveness

Browser
Compatibility

Bugs

Suggested Approach:

- ❖ Record all bugs in README
- ❖ What was the problem?
- ❖ What was the solution?
 - If you could not resolve it, include it in README

Include screenshots of bugs in README

Lighthouse

Code Validation

User Stories

Features

What do we test?

Responsiveness

Browser
Compatibility

Bugs

Recommended Tools and Tips:

- ❖ Google Chrome for Desktop - access via DevTools
- ❖ Disable extensions if they interfere with testing outcomes

Lighthouse

Code Validation

User Stories

Features

- ❖ *Include screenshots of outcomes in README*

What do we test?

Responsiveness

Browser
Compatibility

Bugs

Recommended Tools:

- ❖ HTML <https://validator.w3.org/>
- ❖ CSS <https://jigsaw.w3.org/css-validator/>
- ❖ JavaScript <https://jshint.com/>
- ❖ Python <http://pep8online.com/>

*Include screenshots of outcomes in
README*

Question

How would you go about Validating the templates on your project?

Copy the code from the validated template

HTML/CSS: select validate by direct input
Paste the code

Click Check

Eliminate errors - validate code after each change

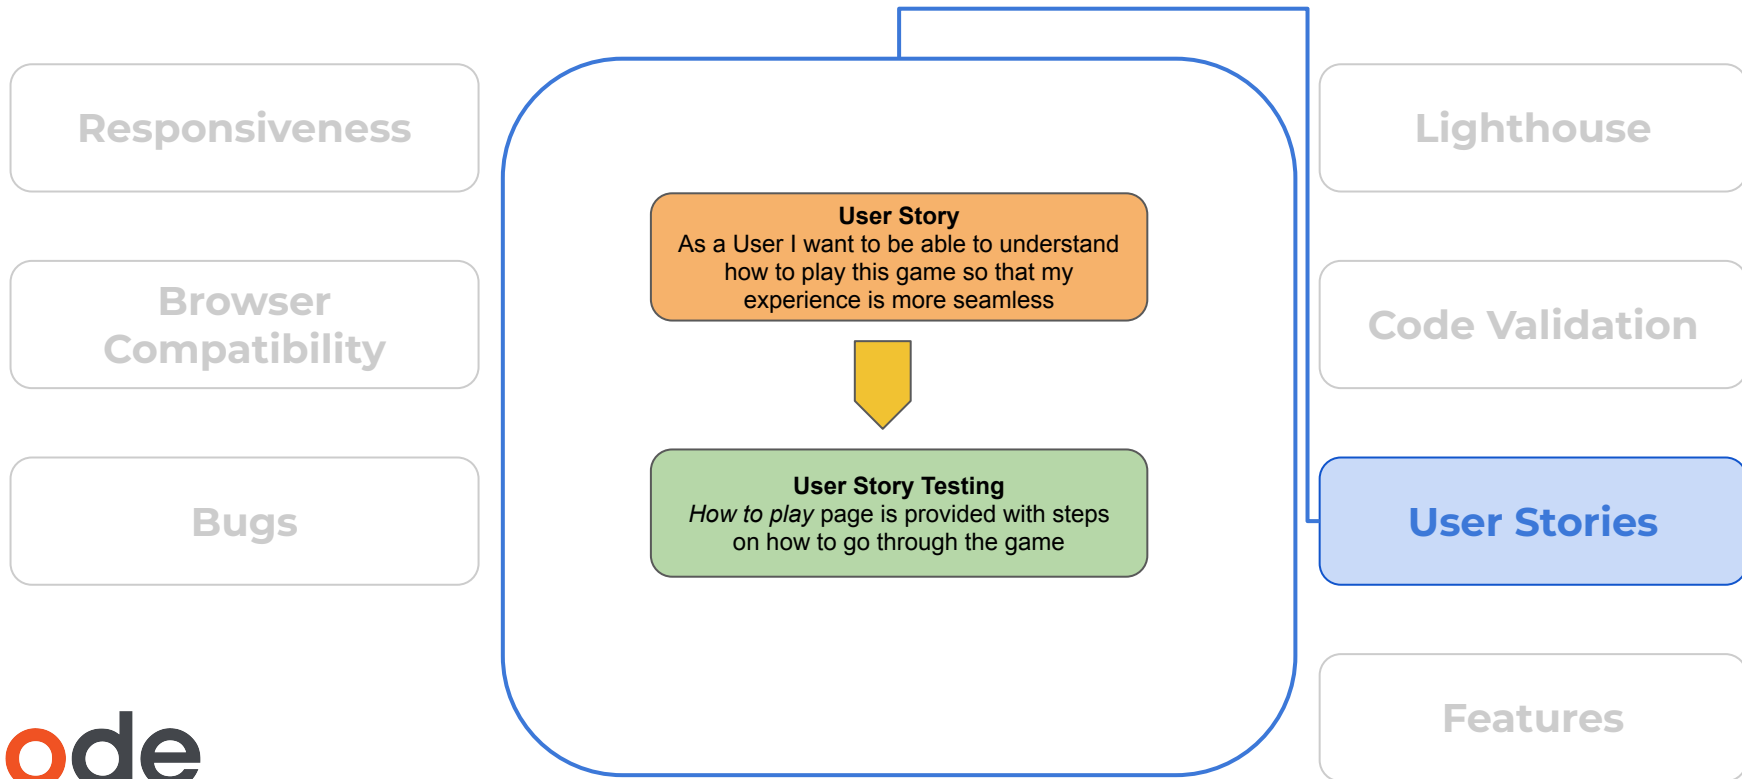

Eliminate warnings - validate code after each change

Every template must be put through validation, if you have multiple html, css, js, py files, code from each of those files must be validated and errors eliminated.

Leaving errors in may cause Fail
Leaving warnings must not break functionality and must be addressed in the README

Validations		NOTES
HTML	Checked on https://validator.w3.org	Document checking completed. No errors or warnings to show.
CSS	Checked on https://jigsaw.w3.org/css-validator	W3C CSS validator cannot parse root variables. <i>:root + var(--foo)</i>
JavaScript	Checked on https://jshint.com	<i>KeyboardEvent</i> is not defined. This is used for keyboard interaction.

Compatibility

Bugs

In the README it could look like this:

User Story	Testing
As a shopper I want to be able to view the list of products to purchase some	<ul style="list-style-type: none">• The list of products is available as per below• Home page - click on Shop Now buttonEverything - choose the desired filtering or choose 'Everything'
As a shopper I want to be able to view individual product details to identify the price and description	<ul style="list-style-type: none">• While at All Products click on a sample Product• The Price and Description is clearly visible
As a shopper I want to be able to quickly identify special offers to take advantage of special savings on products I'd like to buy	<ul style="list-style-type: none">• One of the CTA buttons on navbar is marked as Special Offers and is visible from every page of the website
